1 · THE PROBLEM

Our current order process is a bottleneck

Every hardware order is handled by hand across four systems. One person reads, re-types, checks and emails, and any problem sends the order back to sales by email.

Manual pain point System checked by hand

Manual data entry

Order details are re-typed from PDFs, so typos reach customers and the warehouse.

Swivel-chair checks

Staff switch between inbox, Salesforce and a spreadsheet for every single order.

Slow exception loop

Problems go back to sales by email, and orders sit waiting for hours or days.

Doesn't scale

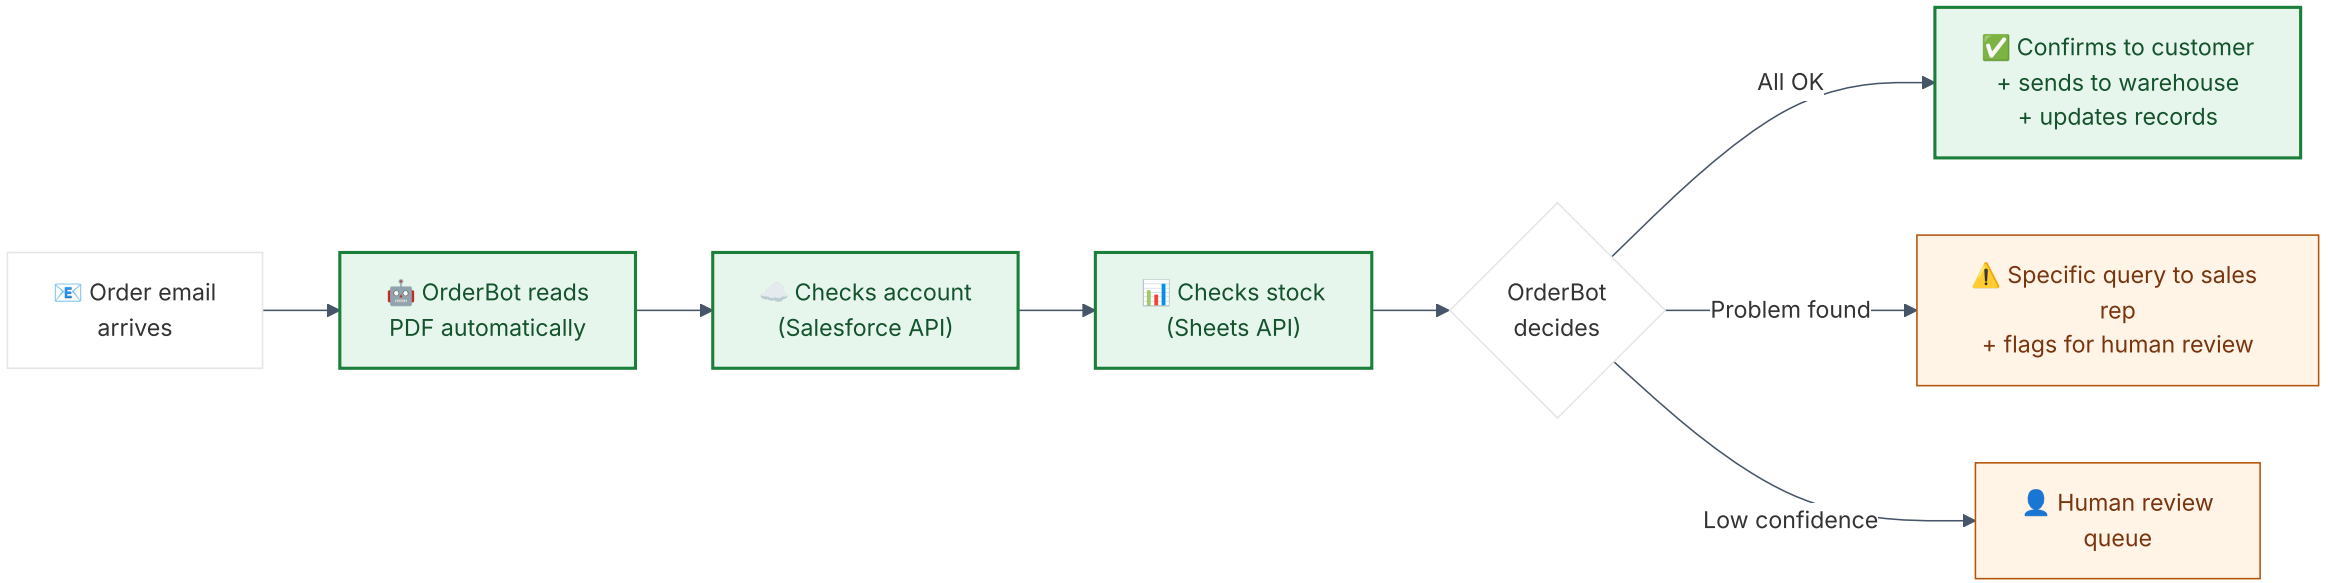

More orders means more staff time. Busy periods create backlogs and no audit trail.

2 · THE SOLUTION

Introducing OrderBot, our autonomous AI agent

Goal: process every new hardware order from email to fulfilment confirmation in **under 5 minutes**, at **99.5% accuracy**, and pass anything uncertain to a person.

👀 Reads

Watches the order inbox and pulls the details out of each PDF automatically.

🔎 Checks

Looks up the customer's account in Salesforce and stock levels in the inventory sheet.

⚖️ Decides

If everything is OK, it proceeds. If not, it tells sales exactly what's wrong. If it's unsure, a person reviews.

✅ Acts and learns

Emails the customer and warehouse, updates the records, and logs every order to keep improving.

Tools: Email reader and sender · PDF parser · Salesforce API · Google Sheets API

Faster orders, fewer errors, and time back for the team

OrderBot takes the repetitive work off the operations team, so people focus on customers and exceptions instead of copying data between systems.

< 5 min
Faster fulfilment
Target time from email to warehouse, instead of waiting in a shared inbox.

99.5%
Fewer errors
Target accuracy. No re-typing, and every check is applied the same way every time.

Hours back
Freed-up staff time
The team moves from data entry to handling real exceptions and customer care.

Lower cost
Scales without hiring
Order growth no longer means more manual effort, and every decision is logged.

🛡️ Safeguards built in

Uncertain or unusual orders go to a person. All actions are logged and auditable. OrderBot uses read-only access until it's proven.

📏 How we'll measure success

Accuracy against human decisions, time per order, exception rate, and staff hours saved each week.

Recommended next step: a 4-week read-only Proof of Concept

OrderBot runs **alongside** the team on real orders. It reads, checks and **drafts** its decisions, but sends nothing and changes nothing. We compare its results with the team's each week. If it meets the 99.5% accuracy target, we enable actions step by step, starting with confirmation emails.

The 5-minute and 99.5% figures are targets to validate during the Proof of Concept.
